1. EXECUTIVE SUMMARY

Morón Basketball Club concluded the 2025–26 regular season in 5th place with a 16–10 record — two wins behind the top spot and two losses away from the promotion playoff cutoff. The team reached the playoffs while avoiding the two strongest teams from the East group. Offensive ranking: 5th. Defensive ranking: 7th. Net Rating: 8th.

Key Indicators

Final Record 16–10 • GOOD 5th place	Offensive Rating 5th • GOOD Top half	Defensive Rating 7th • GOOD Competitive	Net Rating 8th • AVERAGE Positive road
Home Record 6–7 • POOR 10th — gap to close	Away Record 10–3 • ELITE 1st in the group	Playoff Entry ✓ • VERY GOOD Primary objective	No wins vs. 2 • AVERAGE Valladolid. & Caja 87

Key Findings

- ▶ **Best Road record in the group (10–3). The team is more effective away from home than at home — a statistical inversion that requires a structural explanation heading into the playoffs.**
- ▶ Home record (6–7, 10th) is the main performance gap between the team's standing and its ceiling.
- ▶ Shooting efficiency — especially inside and from three — was the team's clearest competitive edge throughout the season.
- ▶ Offensive rebounding (11th) and free throw conversion (12th, concentrated in one player) are the two most correctable inefficiencies.
- ▶ Playoff qualification was achieved with a two-win margin. The bracket avoided the group's two strongest teams.

2. CURRENT STANDING

The team completed the 26-game regular season with a 16–10 record. The table below shows the competitive picture within the group.

Metric	Value	Context
Final record	16–10 (61.5%)	Two wins above playoff cutoff
Group position	5th of 14	Playoffs secured
Home	6–7 (46.2%)	10th — below group average
Away	10–3 (76.9%)	1st — best road team in group
Gap to top spot	–2 wins	Within reach next season
Unbeaten opponents	Valladolid, Caja 87	Top 4 finishers

Season Headline

The team posted the best away record in the group (10–3) while finishing 10th at home (6–7). Reversing this split at any level would significantly improve the standings. This gap — not overall quality — is the main variable separating the team from a top-three finish.

3. GAME-BY-GAME EVOLUTION

Three distinct phases shaped the season's trajectory.

Phase 1 — Slow Start (Games 1–7)

- ▶ 3–4 record. Inconsistent results; squad not at full competitive fitness.
- ▶ Only significant road loss of the season: –20 at Clavijo.
- ▶ All three home losses in this phase came against teams that finished in the top four.

Phase 2 — Stabilisation & January Slump (Games 8–17)

- ▶ Five-game winning streak followed the slow start.
- ▶ Back-to-back home defeats against Logrobasket and Jaén cost the team a top-two finish.
- ▶ In both home defeats the team posted its two lowest eFG% of the season at home.

Phase 3 — Strong Closing Run (Games 18–26)

- ▶ **7–2 record — third-best closing stretch in the group.**
- ▶ Road wins at Toledo and León. Also wins at home vs Ponferrada and Córdoba.
- ▶ Third Best Team in Net Rating

Phase	Record	Key Event
Phase 1 — Opening stretch	3–4	Clavijo loss (–20); all home defeats vs. top-4
Five-game winning streak	5–0	Best consecutive run of the season
Phase 2 — January/February slump	Mixed	Logrobasket & Jaén home defeats (lowest eFG%)
Phase 3 — Final 9 games	7–2	3rd Net Rtg. Wins vs Córdoba, Ponferrada, Toledo & León

4. OFFENSIVE ANALYSIS

Fifth-place offensive ranking (OER) across the 14-team group. Clear strengths in shooting; a small number of specific areas cap the efficiency ceiling. Percentile figures are relative to the full group.

METRIC	RANK	PERCENTILE	ASSESSMENT
Effective Field Goal% (eFG%)	2nd / 14	92nd	• ELITE
2-Point Shooting (PPT2)	1st / 14	100th	• ELITE
3-Point Shooting (PPT3)	4th / 14	77th	• VERY GOOD
Offensive Rebound % (OREB%)	11th / 14	23rd	• POOR
Free Throw Attempt Rate (FTA Rate)	5th / 14	69th	• GOOD
Free Throw % (FT%)	12th / 14	15th	• POOR
Turnover % (TO%)	4th / 14	77th	• VERY GOOD

Shooting — Strongest Area in the Group

- ▶ Every rotation player averages above 0.9 PPT2; only three finish below 1.0.
- ▶ Correia and Orlov are the most efficient rim finishers in the rotation by volume and conversion rate.
- ▶ The team generates high-quality shots and converts them consistently. This is the offensive foundation.

Ball Security — Solid

- ▶ 4th in turnover rate. Disciplined ball-handling across the rotation.
- ▶ A. Marín is the only player averaging above 2 turnovers per game (2.15). No systemic issue.

Offensive Rebounding — Biggest Gap in the Profile

11th in OREB% is the most correctable inefficiency on offense. The Correia/Orlov split shows a clear on-court differential:

Player	OREB / 40 min	Team OREB% On Court	Note
Correia	5.34	31.4%	+6.5 pp above Orlov lineups
Orlov (starter)	2.40	24.9%	Starter baseline
Jiménez (3/4)	0.52	26.1%	Limited OREB presence for a 3/4

Rebounding Gap

Team OREB% is 31.4% with Correia on the floor and 24.9% with Orlov — a 6.5 pp difference that shows up directly in second-chance points. Jiménez, who plays regular minutes at the 4, also registers limited offensive rebounding presence. Both gaps need to be addressed before the playoffs.

Free Throws — One Player, One Fix

- ▶ 12th in FT% is almost entirely explained by Correia: 3.96 FTA per game at 36.9%.
- ▶ The team draws fouls well (5th in FTA Rate). Correia's conversion rate is the one variable diluting this asset.
- ▶ Targeted practice on this specific area has a clear and measurable upside.

Seventh-place defensive ranking in the group. Solid across most areas with a home/away divergence on three-point defence that is the single biggest structural issue — covered in full in Section 6.

Defensive Rebounding — Reliable

- ## Limiting Opponent Free Throws — Consistent Discipline

- ### Three-Point Defence — Strong Away, Weak at Home

- ▶ **Away from home: opponents shoot at very low efficiency from three — among the best figures in the group.**
- ▶ **At home: opponent three-point shooting rises significantly. The gap is covered in detail in Section 6.**

6. HOME & AWAY PERFORMANCE

The team's -9.14 Net Rating differential between home and away games is the defining performance split of the season. Every major shooting efficiency metric is worse at home. The root cause is three-point shooting — both directions.

Global Performance

Metric	Home	Away	Gap
Net Rating	-0.52	$+8.62$	-9.14
Offensive Efficiency	100.45	103.89	-3.44
Defensive Efficiency	100.97	95.64	$+5.33$
Pace (possessions)	78.35	76.33	$+2.02$

Offensive Breakdown

Metric	Home	Away	Gap
eFG%	50.49%	54.00%	-3.51 pp
PPT2	1.06	1.10	-0.04
PPT3	0.92	1.05	-0.13
OREB%	28.16%	27.75%	$+0.41$ pp
FTA Rate	0.39	0.35	$+0.04$
Turnover %	15.46%	16.43%	-0.97 pp

The offensive gap comes down to one factor: three-point shooting. The team shoots 31% from three at home versus 35% on the road. All other offensive metrics are stable across locations.

Defensive Breakdown

Metric	Home	Away	Gap
Opp. eFG%	50.53%	47.43%	$+3.10$ pp
Opp. PPT2	1.02	1.01	$+0.01$
Opp. PPT3	0.99	0.87	$+0.12$
Opp. OREB%	75.17%	70.88%	$+4.29$ pp
Opp. FTA Rate	0.31	0.31	0
Opp. TO%	14.65%	17.41%	-2.76 pp

Defensively, opponents shoot 0.99 PPT3 at home versus 0.87 on the road. They also turn the ball over less at home (14.65% vs 17.41%). Both findings point in the same direction: closeout execution and defensive pressure drop at home.

Root Cause

Three-point shooting in both directions explains the 9.14-point Net Rating gap. The team shoots better from three on the road (+4 pp) and concedes lower three-point efficiency away (+0.12 PPT3 worse at home). Sustained closeout discipline within the Plug & Hedge scheme — specifically at home — is the single most impactful defensive adjustment for the playoffs.

7. LINEUP OPTIMIZATION

Chabi Yo (injury), Navarro, and Parejo (insufficient minutes) are excluded. All figures reflect meaningful samples across the regular season.

Orlov vs. Correia — Net Rating Split

Net Rating w/ Orlov +7.4 • VERY GOOD <i>Better overall lineup output</i>	Net Rating w/ Correia -0.9 ● AVERAGE <i>Stronger offensive glass</i>	OREB% — Correia on 31.4% • VERY GOOD +6.5 pp vs. Orlov lineups	OREB% — Orlov on 24.9% ● BELOW AVERAGE <i>Weaker on the offensive glass</i>
---	---	---	--

- ▶ Lineups with Orlov perform +8.3 Net Rating points better overall, driven by superior team shooting efficiency.
- ▶ The rebounding gap favours Correia significantly. Both players should feature; minutes depend on game situation.
- ▶ Jiménez produces a positive Net Rating across all lineup combinations. His 3/4 flexibility is a structural asset.

Williams — Lineup Compatibility

Williams' on-court impact depends heavily on which power forward he plays alongside. Since Chabi Yo's absence, finding an effective Williams combination has been a recurring issue during the second half of the season.

Configuration	Performance	Recommendation
Williams + Burgos (4)	Strongly negative	Avoid in playoff rotation
Williams + G. Fernández (4)	Positive	Preferred Williams lineup
Williams + Jiménez (hybrid 4)	Competitive	Viable rotation option

Lineup Note — Williams

The Williams + Burgos pairing has consistently underperformed. This is a compatibility issue, not a question of individual quality. In playoff rotations, Williams should play alongside Fernández or Jiménez — not Burgos.

8. FORM — FINAL STRETCH

The closing stretch of the season was the team's strongest phase. 3rd in Net Rating across the group during this window, with the 2nd-best offensive rating and 7th-best defensive rating.

METRIC	RANK	PERCENTILE	ASSESSMENT
Net Rating (final stretch)	3rd / 14	83th	• VERY GOOD
Offensive Rating	2nd / 14	92nd	• VERY GOOD
Defensive Rating	7th / 14	54th	• GOOD
eFG% — 57.8%	1st / 14	100th	• ELITE
2-Pt Shooting — 55.0%	2nd / 14	100th	• ELITE
3-Pt Shooting — ~41.8%	1st / 14	93th	• ELITE

Shooting Numbers — Context Required

- ▶ 57.8% eFG%, 55% on 2PT and 41.8% from three in the closing stretch are well above this team's season averages.
- ▶ Playoff opponents will adjust. Offensive structure needs to produce quality looks without relying on these conversion rates holding.
- ▶ The absence of Chabi Yo has not affected shooting efficiency, but it has affected rebounding.

Rebounding — Declining Trend

DREB% — Season 72.4% • GOOD Season baseline	DREB% — Final stretch 68.4% • BELOW AVERAGE Declining — 4 pp drop	OREB% trend ↓ • POOR Also declining	Probable cause Injury • AVERAGE Chabi Yo absence
--	--	---	---

Rebounding Trend — Playoff Risk

Defensive rebounding dropped from 72.4% to 68.4% in the closing stretch, likely connected to Chabi Yo's absence. Offensive rebounding is also trending down. Playoff opponents will target the glass if this pattern continues. Orlov and Jiménez need to deliver more on the boards.

9. CONCLUSIONS & RECOMMENDATIONS

The team qualified for the playoffs with a two-win margin and avoided the group's two strongest opponents. The road record (10–3) demonstrates the team can win in difficult environments. The home record (6–7) is the main unresolved issue.

Season Summary

Primary Objective	Home Performance	Away Performance	Offensive Ranking
✓ • VERY GOOD Playoffs reached	6–7 • POOR 10th — needs work	10–3 • ELITE Best in group	5th • GOOD Strong — sustainable?

Recommendations — Playoff Preparation

- SHOOTING REGRESSION.** Current 3PT rates near 42% will not hold. Build sets that generate quality shots at lower conversion rates — not systems that require elite shooting to function.
- REBOUNDING.** Both offensive and defensive rebounding have declined in the final stretch. Orlov and Jiménez need to contribute more on the glass. The 4th-place DREB% must be protected actively.
- WILLIAMS LINEUP.** Remove the Burgos + Williams pairing from the rotation entirely. Williams plays alongside Fernández or Jiménez — no exceptions in critical minutes.
- THREE-POINT DEFENCE AT HOME.** Home PPT3 conceded (0.99) is 0.12 worse than away (0.87). Consistent closeout execution within the Plug & Hedge scheme is the most coachable fix before the first playoff game.
- CORREIA FREE THROWS.** 36.9% on 3.96 attempts per game is a fixable efficiency loss. Targeted work on this before the playoffs has a clear and direct impact on margins.

Priority Matrix

Area	Priority	Key Number	Action
Home performance gap	CRITICAL	NRtg –9.14 vs. away	3PT defence & Plug/Hedge closeouts
Shooting regression risk	HIGH	eFG% 57.8% — unsustainable	Build structure, not volume shooting
Rebounding recovery	HIGH	DREB% 72→68% declining	Orlov & Jiménez minutes/demands
Williams lineup	HIGH	Burgos pairing negative	Fernández/Jiménez only
Correia FT conversión	MEDIUM	36.9% on 3.96 FTA/G	Targeted practice before playoffs
